Download ViaSpania 1.0.0

Open GitHub Releases and select the “ViaSpania 1.0.0” draft. Under Assets at the bottom of the page, download the file for your system.

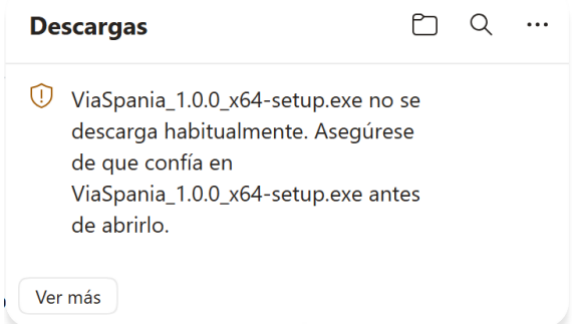

- **Windows x64** `ViaSpania_1.0.0_x64-setup.exe` is the recommended installer. Use `ViaSpania_1.0.0_x64_en-US.msi` for MSI or managed installations; “en-US” in the filename does not limit the interface language.

- **macOS Apple Silicon** Download the ARM64 DMG.

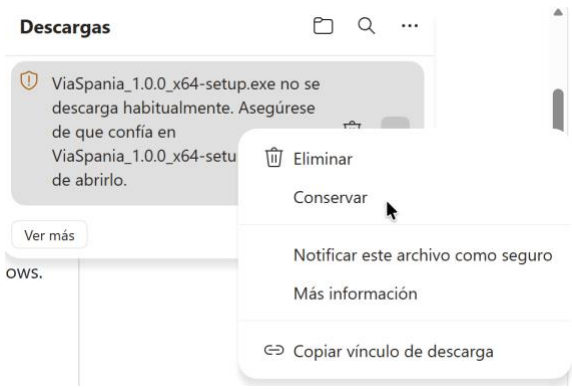

- **Linux** Download the package that matches both your distribution and your computer’s architecture: use `.deb` on Debian, Ubuntu, and compatible distributions; `.rpm` on Fedora, openSUSE, and compatible distributions; or AppImage as a standalone format. For 64-bit Intel or AMD computers, choose `amd64` or `x86_64`; for 64-bit ARM computers, choose `arm64` or `aarch64`. Open `.deb` and `.rpm` packages with your distribution’s software installer. To run an AppImage, you may need to grant it permission to run.

1. Windows x64

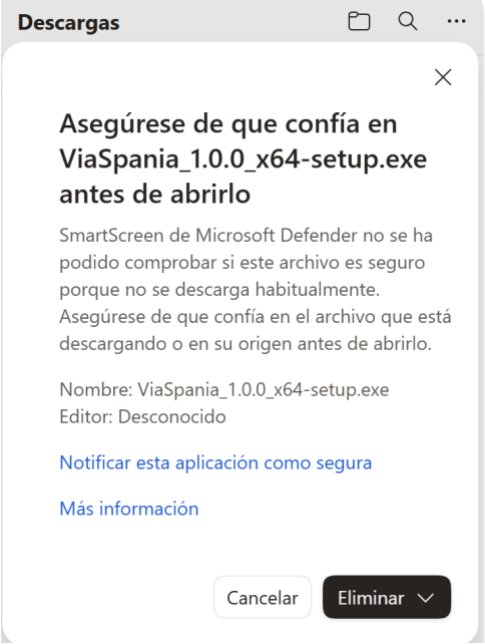

Step 1. Edge warns that the installer is not commonly downloaded. In Downloads, `ViaSpania_1.0.0_x64-setup.exe` appears with the warning “isn’t commonly downloaded.” Select “See more” (Ver más in the screenshot) to view the options. This warning reflects a lack of reputation because the application has not yet been notarized.

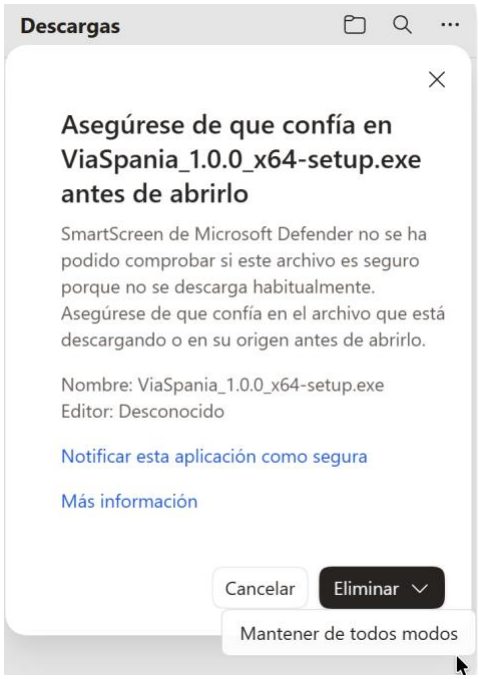

Step 2. Open the file options. The three-dot menu at the top right of the warning shows “Delete” (Eliminar), “Keep” (Conservar), “Report this file as safe” (Notificar este archivo como seguro), and “More information” (Más información). Select “Keep.”

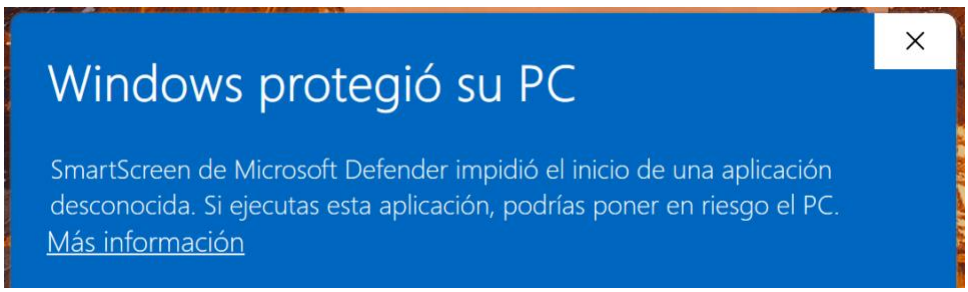

Step 3. Read the SmartScreen details. After selecting “Keep,” Microsoft Defender SmartScreen displays a warning that it could not verify whether the file is safe because it is not commonly downloaded. It shows the installer name and “Unknown publisher” (Editor: Desconocido).

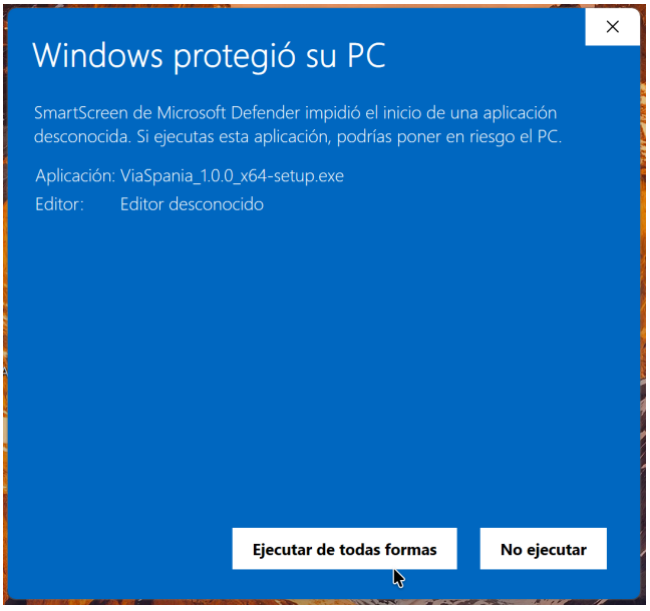

Step 4. Keep the file anyway. Open the drop-down using the arrow next to “Delete” (Eliminar) and select “Keep anyway” (Mantener de todos modos). You do not need to select “Report this file as safe” to install the application; that option sends a report to Microsoft.

Step 5. Windows blocks the first launch. When you open the EXE file, you may see “Windows protected your PC”: SmartScreen blocked an unrecognized app from starting. Select “More info” so Windows displays the app and publisher names.

Step 6. Confirm the app before running it. After you select “More info,” Windows shows `ViaSpania_1.0.0_x64-setup.exe` and “Unknown publisher,” and offers “Run anyway” and “Don’t run” (. Select “Run anyway.” If anything looks different, or a managed computer blocks this action, select “Don’t run” and contact your system administrator.

MSI installer

1. Open the Package. Use `ViaSpania_1.0.0_x64_en-US.msi` if you need the MSI format or your organization instructs you to use it.

2. Complete Windows Installer. Confirm the installation when Windows prompts you, and wait for it to finish. Then open ViaSpania from the Start menu.

If Windows or your organization’s policy blocks the installation, do not disable its protections. Contact your computer administrator.

When the installer opens, follow the Windows setup wizard and confirm the installation. When it finishes, open ViaSpania from the Start menu or its shortcut.

2. macOS Apple Silicon

1. Install the application. First, drag ViaSpania from the mounted installer to the Applications folder. Close the installer and eject the volume. Because ViaSpania has not yet been notarized by Apple, opening it before removing the quarantine attribute may trigger a Gatekeeper warning such as “Apple cannot check ‘ViaSpania’ for malicious software,” “the developer cannot be verified,” or that the app is damaged. To proceed with the official app, remove its quarantine attribute as described below.

2. Open Terminal. In Finder, go to Applications → Utilities → Terminal. Type:

```
xattr -d com.apple.quarantine /Applications/ViaSpania.app
```

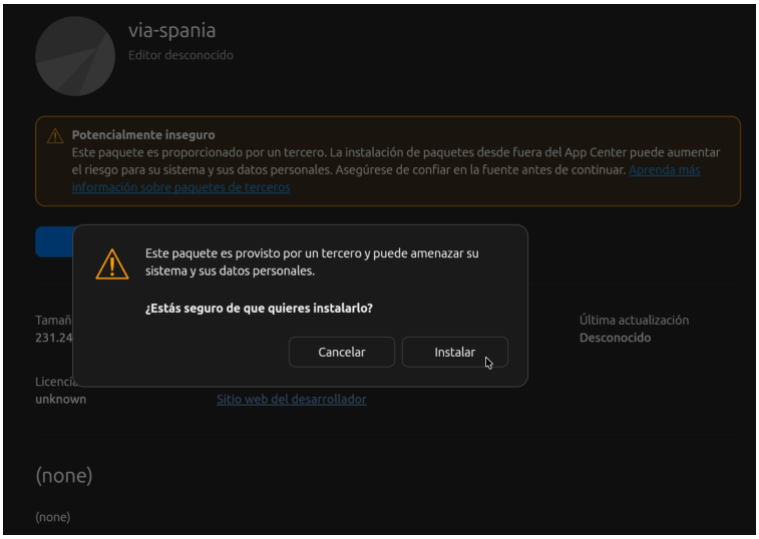

3. Run the command and open the app. Press Return in Terminal. If no error appears, open ViaSpania from Applications.

3. Linux

1. Download and install the appropriate package. Under Assets, select the Linux package that matches your distribution and architecture (Intel/AMD x64 or ARM64). Open the file with your system's software installer.

2. Confirm the installation. The software center may warn that the package is provided by a third party and could put your system and personal data at risk, or that the publisher is unknown. If so, continue to the next step.

3. Authenticate and open the application. When prompted, enter your account password and select “Authenticate.” Wait for the installation to finish, then open ViaSpania from the applications menu.
